Midas Gold currently is currently exploring the area surrounding the historic Stibnite Mining District in central Idaho and developing plans to support potential future mining and production of gold, silver, and antimony. Midas utilizes a variety of tools and techniques to limit exploration disturbance and potential impacts including helicopter supported drilling and reclamation operations. Additionally, a robust set of Standard Operating Procedures (SOP's) have been developed and implemented for activities such as; fuel haulage and management, spill contingency, sediment control, drilling activities and water use, water withdrawal from surface sources, sediment control Best Management Practices (BMP's) including inspection and maintenance, drill hole abandonment, surface water monitoring, reclamation of drill sites and previously disturbed ground, tree planting, and a variety of other procedures designed to limit potential impacts to surface water and ground water, vegetation, and wildlife in the area.

This talk will focus on the current practices at the Stibnite Gold Project and provide information on the thinking, approach, and concepts used to prepare the recently completed preliminary feasibility study.
